

STAC Discussion

For the whole group

Format

- No more than ten minutes per topic
- If going over then designate a group to go work on a concrete proposal (PR in github)
- If answer is clear then assign someone to write up issue / PR
- Additional topics welcome, but if it can be fully handled by a smaller group (static stac, stac api, etc) then may be best to not involve everyone

- **thumbnails in assets** - The first spec put thumbnail in 'links', though it feels more like an 'asset'. Should we just move it to 'assets'? Does anyone have good reasons not to?
- **observed / duration vs start / end** - Planet internals ended up using observed + duration. This is probably our last opportunity to change something so substantial.
- **relative vs absolute links** - We decided to allow both relative and absolute links. Should we adopt one or the other? Or at least a convention of when it is ok to use each? Should 'self' be required to be an absolute link?
- **assets to dict, asset definition** - A couple items from the EO profile discussion with broader relevance
- **naming of content extension / profiles / ?** - We don't have a clear name for when someone is using all the same api / static json mechanisms but is making their own validating schema - both community & vendor specific.
- **process & momentum** - What process should we use for making improvements? PR's/ issues / ? Do we start doing 'releases'? What determines a release point? How can we make more progress on the spec virtually? Remote only hack days? other ideas?
